Jenzi Bottom Finder Leads with cork insert - precise sounding for your perfect catch

The Jenzi Bottom Finder Leads with cork insert is an indispensable tool for any angler who wants to determine the exact depth of the water and optimise their float. With this high-quality Bottom Finder Lead, you can perfectly adjust your fishing rig to the desired depth and thus ensure the best possible presentation of your bait.

Application - How do you determine the water depth correctly?

The correct way to determine the water depth is to deliberately set the float rig shallower than expected. The distance between the float and the hook should be less than the actual water depth. Once you have cast the rig in the desired position, the plumb line will pull the shallow rig under the water. Now pull in the rig and gradually move the float further towards the rod, increasing the distance between the hook and the plumb lead. Repeat this process until the float is visible above the water surface - this corresponds to the determined water depth.

- Precise water depth determination
- Easy handling
- Optimum bait presentation

Sounding out the water depth is essential in order to present the bait ideally. The bait is best presented slightly resting on the bottom, as most fish prefer to feed from the bottom.
